On the Cover: Comparison of the novel biomarker suPAR (soluble urokinase-type plasminogen activator receptor) vs the well-known biomarker C-reactive protein (CRP). CRP is predominantly associated with dysmetabolism compared with suPAR, which is related to endothelial dysfunction, atherosclerotic plaques, coronary calcification, and microalbuminuria. BMI, body mass index; CABG, coronary artery bypass surgery; STEMI, ST-elevation myocardial infarction. From the review article by Hodges et al., pages 1293-1302 of this issue.
